

 The analysis by hospitals and residence has been updated to July 2012 for the following indicators:

- Proportion of admissions with myocardial infarction underwent PCI within 48 hours from admission.
- Proportion of admissions with ST elevation myocardial infarctions underwent PCI within 48 hours from admission.
- Proportion of hip fracture underwent surgery performed within 48 hours from admission.
- Proportion of laparoscopic cholecystectomy with complications within 30 days from admission.
- Proportion of laparoscopic cholecystectomy discharged within 3 days from intervention.
- Proportion of laparoscopic cholecystectomy on the total of cholecystectomy.

Mortality within 30 days from an admission for myocardial infarction and Proportion of primary caesarean delivery cannot be calculated due to the unavailability of updated data of the Mortality Register and of the Certificates of Delivery Care.

The analysis by hospital ward has been updated to July 2012 for the following indicators:

- Proportion of laparoscopic cholecystectomy with complications within 30 days from admission.
- Proportion of laparoscopic cholecystectomy discharged within 3 days from intervention.
- Proportion of laparoscopic cholecystectomy on the total of cholecystectomy.
